

I. GRAIN-SIZE AND CARBON/CARBONATE ANALYSES, HOLES 417, 418, LEGS 51, 52, 53

Stan M. White, Scripps Institution of Oceanography, La Jolla, California

GRAIN-SIZE ANALYSES

Sand-silt-clay distribution was determined on 10-cm³ sediment samples collected at the time the cores were split and described. The results are listed in Tables 1 and 2.

The sediment classification used here is that of Shepard (1954) with sand, silt, and clay boundaries based on the Wentworth (1922) scale (Figure 1). Thus the sand, silt, and clay fractions are composed of particles whose diameters range from 2000 to 62.5 μm , 62.5 to 3.91 μm , and less than 3.91 μm , respectively. This classification is applied regardless of sediment type and origin; therefore, the sediment names used in this table may differ from those used elsewhere in this volume, e.g., a silt composed of nannofossils in this table may be called a nanno ooze in a site chapter.

Standard sieve and pipette methods were used to determine the grain-size distribution. The sediment sample was dried and dispersed in a Calgon solution. If a sediment sample failed to disaggregate, it was treated

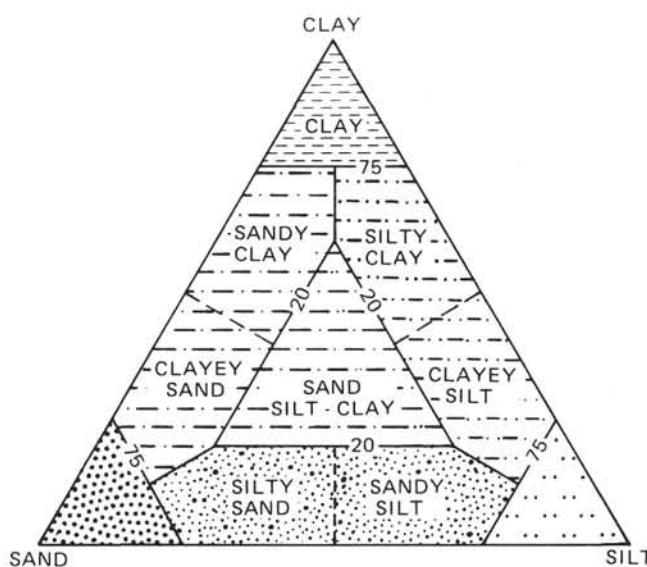

Figure 1. Sediment classification after Shepard (1954) with the sand, silt, and clay size fractions based on the Wentworth (1922) Grade Scale: Sand, silt, and clay size particles having respective diameters of 2000 to 62.5 μm , 62.5 to 3.91 μm , and less than 3.91 μm . Shepard's (1954) sediment classification is a function of sand, silt, and clay size percentages and not composition.

with a sonic probe and, if necessary, hydrogen peroxide. Sediment samples which resisted the above treatment were not analyzed.

The sand fraction was removed by wet sieving using a 63 μm sieve, and the silt and clay fractions were analyzed by standard pipette analysis. Sampling depths and times were calculated using equations derived from Stokes settling velocity equation (Krumbein and Pettijohn, 1938, p. 95-96):

$$\frac{D}{t} = V = \frac{2gr^2(d_1 - d_2)}{9\eta}$$

$$t = \frac{9D\eta}{2gr^2(d_1 - d_2)}$$

where

V = velocity, in cm/sec

t = time, in sec*

D = depth pipette is inserted, in cm

g = gravity, in cm/sec²*

r = radius of individual particles, in cm*

d_1 = density of solid particles arbitrarily set at 2.675 g/cc
absolute density of distilled water at different temperatures (Hodgman et al., 1960, p. 2129).

*Five figures were used in calculations to avoid rounding off variations.

The reproducibility of the grain-size analysis has been previously tested (Boyce, 1972), and it was found that over a period of time with several operators the reproducibility for the sand-silt-clay fractions is ± 2.5 per cent (absolute). For detailed step-by-step procedures, see Volume 4 of the *Initial Reports of the Deep Sea Drilling Project*.

CARBON AND CARBONATE ANALYSES

Sediments recovered during Legs 51-53 were analyzed for total carbon and acid-insoluble (organic) carbon using the new LECO WR-12 Analyzer according to the standard technique outlined below. Because there were only 38 samples, no control standards were run. But the reproducibility of the LECO was verified in extensive tests prior to Legs 51-53 and also in standards run for subsequent legs.

The 3-cm³ sediment samples were first dried and ground into a homogeneous powder. The ground sediment was redried at 105°-110°C and two samples, a 0.1-g and a 0.5-g sample, were weighed into LECO clay crucibles. The 0.5-g sample was acidified with 10 per cent hydrochloric acid and washed with distilled water. The sample was then dried and analyzed for acid-insoluble carbon. The 0.1-g sample was analyzed for total carbon without further treatment. If the sample contained less than 10 per cent CaCO₃, an additional 0.5-g sample was analyzed for greater accuracy. The calcium carbonate percentages were calculated as follows: (% total C - % organic C) \times 8.33 = % CaCO₃. Although other carbonates may be present, all acid-soluble carbon was calculated as calcium carbonate. All results are given in weight per cent (Tables 3 and 4).

Detailed descriptions of the technique and theory may be found in Bader, Gerard, et al. (1970) and Boyce and Bode (1972).
