

8. SPYRIDS, ARTOSTROBIIDS, AND CRETACEOUS RADIOLARIANS FROM THE WESTERN PACIFIC, DEEP SEA DRILLING PROJECT LEG 61¹

Patrick de Wever, Université des Sciences et Techniques de Lille, et Equipe de Recherche Associée au C.N.R.S.
n°. 764, SN 5, 59655 Villeneuve d'Ascq, Cedex, France,

ABSTRACT

Investigations have been carried out on Mesozoic and Cenozoic radiolarians of Site 462. Mesozoic species, when identifiable, were used to determine ages. Cenozoic forms occur abundantly from middle Eocene to Pliocene, and show a moderate to good state of preservation. In these series, spyrids and artostrobiids are especially considered with a view to their possible pertinence in establishing biostratigraphic successions.

INTRODUCTION

Only one site was drilled during Leg 61 of the Deep Sea Drilling Project; its location is 7°14.25'N, 165°01.83'E, and water depth is 5181 meters.

Radiolarians are present throughout the sediment cores of Hole 462, although their state of preservation is variable, so that they are sometimes useless for biostratigraphic identification. In Cores 1 to 39, the radiolarians are abundant and usually well preserved, and they make up the most abundant biogenic component in Cores 23 to 39. In Cores 41 to 60, the abundances vary considerably, but generally are less than in the cores above; moreover, the state of preservation is poor at best and, in most cases, so poor that only a few general outlines are visible. Commonly the radiolarians are calcified and the test has been filled and/or replaced by calcite and zeolite.

In material from Hole 462A, radiolarians are abundant and well preserved in the Neogene cores (Cores 1 and 2). As in Hole 462, they are absent in the Paleogene (Cores 3 to 6) and rare to common, but always poorly preserved, in the Mesozoic sediments.

Aboard the drilling vessel, samples for radiolarian investigation were taken at roughly fixed intervals in the cores. Because most of the sediments are turbidites, it is apparent that the samples are unequally spaced through time. For this reason, samples are much more numerous in some of the time intervals represented. When possible, samples have been taken preferably in red or brown clays.

All the radiolarian samples were processed, aboard the *Glomar Challenger*, with hydrogen peroxide and Calgon, and with 10% hydrochloric acid when necessary. The residues were sieved on a 63-μm sieve.

SCOPE OF INVESTIGATION

A survey of the occurrence of Cenozoic forms of known stratigraphic utility is given in another chapter of this volume (see Sanfilippo et al.). The part of the present chapter dealing with Cenozoic radiolarians surveys

the spyrids and artostrobiids to determine whether some forms not previously used stratigraphically show promise of stratigraphic utility and whether some others are clearly useless.

Mesozoic radiolarians have been investigated for all the samples in which they were identifiable, in order to determine ages.

CENOZOIC RADIOLARIANS

Results

For the Cenozoic sequence of Hole 462, occurrences and abundances of spyrids and artostrobiids have been tabulated in stratigraphic order, as far as possible (Table 1). Species are numbered consecutively, and these numbers are included in the species list.

In the tabulation, as in the paper by Sanfilippo et al. (this volume), indications of abundance and preservation and five columns for reworking are given. The existence of turbidites limits the usefulness of this arrangement, so in order to have a stratigraphic order of species less influenced by the reworking, two other tables (2 and 3) are presented, taking into account only the samples with less than 1% of the specimens reworked, accordingly to the percentages shown in Table 1.

Letters and symbols in the tables are defined as follows:

Preservation:	G	Good
	M	Moderate
	P	Poor
Abundance:	A	Abundant (more than 500 specimens counted)
	C	Common (51 to 500 specimens counted)
	F	Few (11 to 50 specimens counted)
	R	Rare (4 to 10 specimens counted)
	+	Very rare (less than 4 specimens per slide)
	?	Uncertain identification

From Table 2, it appears that several species are definitely useless for stratigraphic purposes; these in-

Table 1. (Continued).

clude *Tholospyris cortinisca*, *Liriospyris mutuaria*, *Tholospyris anthopora*, *Dendrospyris damaecornis*, *Dorcadospyrus confluens*, *Dictyoprora urceolus*, *Siphostichoartus lineata* group, *Dorcadospyrus pentagona*, and, to a lesser extent, *Phormostichoartus marylandicus*.

Some other species, having short ranges and distinct upper and lower limits, seem to be promising. These are, for example, *Liriospyris parkerae* (middle Miocene), *L. stauropora* (middle Miocene to upper part of lower Miocene), *Siphostichoartus praecorona* (Oligocene to lower Miocene), *Siphostichoartus elizabethae* (upper Eocene to Oligocene), and *Dictyoprora armadillo* (Eocene). Even if one section is not sufficiently significant, we may note that first occurrences of some species correspond to last occurrences of others: *Dictyoprora ovata* and *Dorcadospyrus simplex* disappear (Sample 462-14-5, 109-111 cm with the first occurrence of *L. parkerae*, and the same pertains to *Dendrospyris inferispina*, *Dictyoprora gigas*, *Dorcadospyrus riedeli*, and *Dorcadospyrus praeforcipata* (Sample 462-29-1, 109-11 cm).

In order to avoid a long discussion—which might be confusing and which could be taken more seriously than I would like, because of the limited number of samples taken in account—Tables 2 and 3 present the different species arranged in stratigraphic order corresponding to the tops (last occurrences, Table 2) and bottoms (first occurrences, Table 3). Tables 2 and 3 permit easy comparison of the tops and bottoms for different species.

Comparisons with Previous Work

Only a few authors have previously made detailed surveys of spyrids and artostrobiids. The most detailed work on spyrids is that by Goll (1968, 1969, 1972), and Nigrini (1977) has recently reviewed tropical artostrobiids, so it may be interesting to see how our results fit with theirs.

The ranges of artostrobiids surveyed here correlate well with those established by Nigrini (1977, p. 247). Several remarks, however, seem worthwhile: (1) *Siphostichoartus praecorona* seems to have a longer range at Hole 462, occurring in some sediments older than those in which it was found by Nigrini (1977). The same is true of *Botryostrobus auritus-australis*, which occurs rarely from upper Oligocene to Pliocene. (2) *Siphocampe acephala*, *S. elizabethae*, *Dictyoprora ovata*, *D. amphora*, and *D. mongolfieri* have a few occurrences younger than those given by Nigrini (1977), but they may result from reworking. (3) Reworking could be the reason also for the range of *Dictyoprora urceolus*, but this is not likely, because the occurrences of this form are very frequent.

Comparing the results presented here with Goll's results, the following remarks are pertinent:

1) For my results to be comparable with Goll's, it is necessary to add the ranges of species from his 1968-1969 papers with those of 1972; taken singly, his ranges seem too restricted.

2) Leaving aside the younger occurrences of several species here, to avoid setting up differences where perhaps they are only a consequence of reworking, sev-

eral differences between my ranges and Goll's are apparent. The main differences are as follows: (A) *Giraffospyris angulata* occurs in Hole 462 from lower Miocene to Pleistocene (upper Miocene-Pliocene, according to Goll). (B) *Liriospyris mutuaria* occurs from upper Eocene to Pleistocene (lower Miocene to Pliocene, according to Goll). (C) *Tholospyris cortinisca* occurs from upper Eocene to Pleistocene (middle Miocene to Pliocene, according to Goll). (D) *T. scaphipes* occurs from upper Oligocene to Pliocene (middle Miocene to Pliocene, according to Goll). (E) *T. mammillaris* occurs from upper Eocene-lower Oligocene to upper Miocene-Pliocene (upper Oligocene to Pliocene, according to Goll). (F) *Giraffospyris circumflexa* occurs from upper Oligocene to Pleistocene (middle Miocene to Pliocene, according to Goll).

LIST OF CENOZOIC SPECIES

The purpose of this listing is to provide bibliographic references to the taxa mentioned in this report and in its accompanying tables. When the published literature contains several different concepts of the limits of a species, the reference cited conforms to the concept as applied here. For each species, this list gives at least one recent reference containing appropriate species descriptions and illustrations, thereby enabling the reader to determine the criteria which have been applied in identifying the taxa in this report.

- Botryostrobus aquilonaris* (Bailey). Nigrini, 1977, p. 246, pl. 1, fig. 1. Table 1, number 12; Tables 2, 3, number 1'.
- Botryostrobus auritus-australis* (Ehrenberg) group. Nigrini, 1977, p. 246, pl. 1, figs. 2-5. Table 1, number 13; Tables 2, 3, number 5'.
- Botryostrobus bramlettei* (Campbell and Clark). Nigrini, 1977, p. 248, pl. 1, figs. 7, 8. Table 1, number 26; Tables 2, 3, number 24'.
- Botryostrobus miralestensis* (Campbell and Clark). Nigrini, 1977, p. 249, pl. 1, fig. 9. Table 1, number 51; Tables 2, 3, number 39'.
- Ceratospyris articulata* Ehrenberg, 1873, p. 218. Sanfilippo and Riedel, 1973, p. 526, pl. 15, figs. 1-3; pl. 31, figs. 8, 9.
- Dendrospyris acuta* Goll. Sanfilippo and Riedel, 1973, p. 526, pl. 15, fig. 5; pl. 31, fig. 11. (This chapter: Pl. 2, Fig. 9.) Table 1, number 17; Tables 2, 3, number 13'.
- Dendrospyris anthocytoides* (Butschli). Riedel and Sanfilippo, 1971, p. 1590, pl. 5, figs. 5-7. Table 1, number 10; Tables 2, 3, number 6'.
- Dendrospyris binapertonis* Goll, 1968, p. 1420, pl. 173, figs. 5, 6, 10, 11; text-fig. 8. (This chapter: Pl. 3, Fig. 4.) Table 1, number 4; Tables 2, 3, number 10'.
- Dendrospyris damaecornis* (Haeckel). Goll, 1968, p. 1420, pl. 173, figs. 1-4; text-fig. 8. (This chapter: Pl. 3, Fig. 3.) Table 1, number 15; Tables 2, 3, number 16'.
- Dendrospyris fragoides* Sanfilippo and Riedel, 1973, pl. 526, pl. 15, figs. 8-13; pl. 31, figs. 13, 14. Table 1, number 45; Tables 2, 3, number 32'.
- Dendrospyris inferispina* Goll, 1968, p. 1421, pl. 174, figs. 5-8, 10; text-fig. 8. Table 1, number 74; Tables 2, 3, number 70'.
- Dendrospyris pannosa* Goll, 1968, p. 1421, pl. 173, figs. 13, 15, 19; text-fig. 8. Table 1, number 59; Tables 2, 3, number 54'.
- Dendrospyris pododendros* (Carnevale). Goll, 1968, p. 1422, pl. 174, figs. 1-4; text-fig. 8. Table 1, number 34; Tables 2, 3, number 60'.
- Dendrospyris stabilis* Goll, 1968, p. 1422, pl. 173, figs. 16-18, 20; text-fig. 8. (This chapter: Pl. 2, Fig. 4.) Table 1, number 16; Tables 2, 3, number 15'.
- Dendrospyris stylophora* (Ehrenberg). Goll, 1968, p. 1423, pl. 173, figs. 21-24; text-fig. 8. Table 1, number 33.
- Dendrospyris turriturcica-dasyotus* Sanfilippo and Riedel, 1973, p. 527, pl. 16, fig. 3; pl. 32, fig. 3. Table 1, number 80; Tables 2, 3, number 69'.
- Dendrospyris turriturcica-turriturcica* Sanfilippo and Riedel, 1973, p. 527, pl. 16, fig. 1; pl. 31, fig. 15; pl. 32, fig. 1. Table 1, number 63; Tables 2, 3, number 56'.
- Dictyoprora amphora* (Haeckel) group. Nigrini, 1977, p. 250, pl. 4, figs. 1, 2. (This chapter: Pl. 4, Fig. 6.) Table 1, number 56; Tables 2, 3, number 46'.

- Dictyopora armadillo* (Ehrenberg). Nigrini, 1977, p. 250, pl. 4, fig. 4. (This chapter: Pl. 4, Fig. 5.) Table 1, number 76; Tables 2, 3, number 74'.
- Dictyopora mongolfieri* (Ehrenberg). Nigrini, 1977, p. 250, pl. 4, fig. 7. (This chapter: Pl. 4, Figs. 8–10.) Table 1, number 50; Tables 2, 3, number 38'.
- Dictyopora ovata* (Haeckel). Nigrini, 1977, p. 251, pl. 4, figs. 5, 6. Table 1, number 37; Tables 2, 3, number 58'.
- Dictyopora pirum* (Ehrenberg). Nigrini, 1977, p. 251, pl. 4, fig. 8. (This chapter: Pl. 4, Fig. 7.) Table 1, number 72; Tables 2, 3, number 66'.
- Dictyopora urceolus* (Haeckel). Nigrini, 1977, p. 251, pl. 4, figs. 9, 10. (This chapter: Pl. 4, Fig. 14.) Table 1, number 19; Tables 1, 2, number 18'.
- Dictyospyris discus* Sanfilippo and Riedel, 1973, p. 527, pl. 16, figs. 4–8; pl. 32, figs. 4–7. Table 1, number 81; Tables 2, 3, number 76'.
- Dictyospyris gigas* Ehrenberg. Sanfilippo and Riedel, 1973, p. 527, pl. 16, figs. 9, 10; pl. 32, figs. 10, 11. Table 1, number 78; Tables 2, 3, number 72'.
- Dorcadospyris alata* (Riedel). Riedel and Sanfilippo, 1970, p. 523, pl. 14, fig. 5; 1971, pl. 2D, fig. 1; Moore, 1971, pl. 11, figs. 3, 4. Table 1, number 47.

MESOZOIC RADIOLARIANS

Mesozoic radiolarians, even when common, were, except rarely, too poorly preserved to be useful for stratigraphic purposes. They were generally encountered in layers of claystone interbedded in eruptive rocks. It was therefore never possible to obtain a sequence of Meso-

zoic radiolarians showing evolutionary changes. The original skeletons of the radiolarians have been replaced and filled with crystalline silica in the best cases, or recrystallized in calcite and/or zeolite, leaving only the gross external features preserved.

These poorly preserved forms cannot be identified to the species level, and seldom can be identified even to the genus level. Names cannot be used with great precision, and they are used conservatively without implying taxonomic agreement or disagreement. In order to provide bibliographic references to the species mentioned here, they are listed. When the published literature con-

tains several different concepts of the limits of a species, the reference cited conforms to the concept as applied here.

In Hole 462, identification of radiolarians from the Cretaceous interval is nearly impossible because the tests have been replaced by zeolite and calcite, which crystallizes in large crystals that distort the specimens. However, Cores 51 (Section 3) and 55 (Section 4) provided somewhat better preserved specimens.

Similarly, in Hole 462A samples, as because of the poor preservation of the radiolarians (replaced by calcite and zeolite) and their distortion, only a few vague high-level taxa can be identified. In Core 43 (Sections 1 and 2), Core 46 (Section 1), and Core 80 (Section 1), however, some identifications were attempted.

The ages attributed to the samples are based on the works of Riedel and Sanfilippo (1974), Foreman (1975), and Pessagno (1977).

The samples yielding the best radiolarians are as follows:

Samples 462-51-3, 41-43 cm: *Alievum gallowayi?*, *Dictyomitra torquata*, *Dictyomitra duedecimcostata*, *Dictyomitra lilyae*, and *Dictyomitra* sp. aff. *D. koslovae*, suggest that this sample belongs to the Upper Cretaceous (Senonian).

Sample 462-55-4, 55-59 cm: *Archaeospongoprnum* sp., *Alievum* sp., *Dictyomitra duodecimcostata*, *Dictyomitra lilyae*, *Dictyomitra somphidia*, and *Dictyomitra torquata*: same as previous sample (Senonian).

Sample 462A-43-1, 36-40 cm: *Dictyomitra lacrimula*.

Table 3. (Continued).

Sample 462A-43-2, 50-54 cm: *Acanthocircus* sp. (*A. trizonalis*?), *Dictyomitra lacrimula*, *Emiluvia* sp., *Eucyrtis tenuis*, *Hagiastriidae*, *Hemicryptocapsa* spp. cf. *H. capita*, *Mirifusus mediodilatatus*, *Thanarla elegans-tissima*, *Sethocapsa cetia*?, *Sethocapsa* sp., *spumellarians*. These forms suggest the *Eucyrtis tenuis* Zone, which is Barremian to Albian p. p., according to Riedel and Sanfilippo (1975), and Valanginian to lower Aptian, according to Foreman, 1975. The specimens are probably Barremian.

Sample 462A-46-1, 1-3 cm: *Acanthocircus carinatus?*, *Crucella* sp., *Dictyomitra lacrimula*, *Emiluvia pessagnoi?*, *Emiluvia* sp. (*E. chica?*), *Hagiastrum* sp., *Podobursa* sp., spongosaltnalids, *Staurosphaera* se-

decimporata. These radiolarians belong to the *E. tenuis* Zone, and, as for the previously mentioned sample, are probably Barremian.

Some radiolarians from the *E. tenuis* Zone again occur in the red-brown claystone interval (Sample 462A-80-1, 16-17 cm), and suggest the same age. The following radiolarians were recognized: *Crucella* sp., *Dicyomitra lacrimula*, *Eucyrtis micropora*(?), *Sethocapsa* sp., *Thanarla elegantissima*, *Thanarla* sp. aff. *T. conica*, and *Mirifusus mediodilatatus*.

ACKNOWLEDGMENTS

I thank the Deep Sea Drilling Project curatorial staff at Scripps Institution of Oceanography (La Jolla, California) for supplying supplementary samples, and A. Schaaf, who reviewed the manuscript. Special thanks are due to W. R. Riedel, who, as usual, kindly offered useful discussions and assistance, and reviewed the manuscript.

Financial support for this investigation was provided in part by C.N.R.S. (France)—A.T.P. 3236.
