

APPENDIX. GEOCHEMICAL DATA FOR BASALTS¹

H. Bougault, Institut Français pour la Recherche et l'Exploitation de la Mer, Centre de Brest,
and
D. Hawkins, Deep Sea Drilling Project, Scripps Institute of Oceanography²

The major-element and most of the trace-element data from the different laboratories that contributed to the study of samples recovered during Leg 82 are presented in the following tables. The different basalt groups, identified on the basis of their chemical properties (major and trace elements), were defined from the data available on board the *Glomar Challenger* as the cruise progressed (see site chapters, all sites, this volume). Most of the data obtained since the end of the cruise and presented in these tables confirm the classification that was proposed by the shipboard party (see site chapters, all sites, this volume). Nevertheless, special mention should be made about Site 564. The shipboard party proposed a single chemical group at this site but noticed significant variations down the hole, mainly in trace-element data. However, the range of variation was small compared to the precision of the measurements. These variations were confirmed by the onshore studies (see papers in Part IV of this volume, especially Brannon's paper, partly devoted to this topic).

Generally, the consistency between the major-element data from different laboratories is fairly good (except sometimes for Na₂O), because of the reliability of the analytical methods, mainly X-ray fluorescence. Although

the consistency is also good for trace elements, some deviation is more common. The accuracy, at least for some of the trace elements, is lower than that of major elements because (1) the concentrations are sometimes closer to the limit of detection, and (2) the concentrations of many trace elements in the international standards are often not known with the precision necessary to permit discrimination between data for unknown samples analyzed by different laboratories. One example of shipboard determinations and derivation of proposed chemical groups is the discussion of Niobium analysis given by Etoubleau et al. (this volume). Niobium, although found in low concentrations in basalts, is a key "hygromagnaphile" trace element for deducing the "enriched" or "depleted" character of the different basalt units. The accuracy of the shipboard measurements of Nb has been verified by use of the constant Nb/Ta ratio in basalts (16) and by instrumental neutron activation analyses for Ta. The accuracy of the shipboard analyses for Nb is better than 1 ppm.

The reader of this appendix should examine the geochemical properties of the elements (e.g., alkali elements in respect to alteration processes) and should not rely on the concentration of a single element to decide that a certain part of a core could be an exception in a chemical unit (e.g., for the purpose of sampling).

We hope that this compilation of all data will be useful in observing variation in chemistry down the different holes and that it will help in selecting samples for future studies.

Note: Sample numbers are given in core-section, interval in cm. Depth is sub-bottom depth.

Investigator (Inv) codes are: BOG = H. Bougault, IFREMER (Chapter 23, this volume); BT = E. Bonatti, Lamont-Doherty Geological Observatory of Columbia University (Chapter 29, this volume); DT = L.V. Dmitriev, Vernadsky Institute of Geochemistry, USSR Academy of Sciences (Chapter 27, this volume); DRA = N. Drake, Department of Geology, University of Massachusetts (Chapter 20, this volume); JCB = J.C. Brannon, Department of Earth and Planetary Sciences, Washington University in St. Louis (Chapter 21, this volume); PUC = H. Puchelt, Institut für Petrologie und Geochemie der Universität Karlsruhe; SHM = H.-U. Schmincke, Ruhr Universität Bochum, Mineralogisches Institut (chapter may be published in future DSDP volume); WEA = B.L. Weaver, Department of Geology, University of Leicester (present address: School of Geology and Geophysics, University of Oklahoma, Norman, Oklahoma 73019) (Chapter 19, this volume).

The methods codes are: XRF = X-ray fluorescence; INAA = instrumental neutron activation analysis; PROBE = electron microprobe; WT = classical wet chemical techniques.

LOI is loss on ignition.

APPENDIX

Table 2. Trace-element compositions (in ppm) for basalts, Leg 82.

Note: Sample numbers are given in core-section, interval in cm. Depth is sub-bottoms depth.

Investigator (Inv.) codes are: BOG = H. Bougault, IFREMER (Chapters 3 and 23, this volume); DRA = N. Drake, Department of Geology, University of Massachusetts (Chapter 20, this volume); JCB = J.C. Brannon, Department of Earth and Planetary Sciences, Washington University in St. Louis (Chapter 21, this volume); PUC = H. Puchelt, Institut für Petrologie und Geochemie der Universität Karlsruhe; SHM = H.-U. Schmincke, Ruhr Universität Bochum, Mineralogisches Institut (chapter may be published in future DSDP volume); WEA = B.L. Weaver, Department of Geology, University of Leicester (present address: School of Geology and Geophysics, University of Oklahoma, Norman, Oklahoma 73019) (Chapter 19, this volume).

The methods codes are: XF = X-ray fluorescence; NA = instrumental neutron activation analysis; XFNAA = XF and NA; XFNAAA = XF and NA and atomic absorption. Bougault's (BOG) samples have been analyzed as follows: V, Cr, Zn, Sr, Y, Nb, and Zr by XF; Sc, Cs, Ba, La, Ce, Eu, Tb, Hf, Ta, Th, and U by Na, Co, Ni, and Rb by both XF and NA.

Table 2. (Continued).
